

## Instructions for adrenal crisis emergency injection kit:

<p>1. Gather supplies including the medication, syringe, and alcohol wipes.</p>	 <p>Labels: SYRINGE, VIAL, ALCOHOL SWABS</p>	<p>2. Wash your hands and put on gloves. Read the label and check the expiration date.</p>	
<p>3. Press down firmly on the yellow top to force the rubber stopper into the vial releasing the solution.</p>		<p>4. Gently mix the solution without shaking it. Turn the vial upside down several times. The solution is initially cloudy, but then clears.</p>	
<p>5. Remove the plastic tab covering the rubber stopper.</p>		<p>6. Wipe the top of the vial with an alcohol wipe.</p>	
<p>7. Place the vial on a firm surface and insert the needle through the rubber stopper.</p>		<p>8. With the needle in the vial, turn the bottle upside down and pull back on the plunger of the syringe to withdraw the correct dose.</p>	
<p>9. Flick out any air bubbles and expel any excess air. Remove the syringe from the vial.</p>	 <p>Labels: Syringe, Plunger</p>	<p>10. Select the site. Injection should go into the outside of the mid-thigh. Clean the skin surface with an alcohol wipe. Inject the needle into the thigh muscle at a 90-degree angle. The needle should go into bare skin (not through clothing into the skin). Push the plunger until the dose is fully injected.</p>	
<p>11. Remove the needle and place in a sharps container. Press a cotton swab firmly over the injection site for a few seconds.</p>		<p>12. If the student is unconscious, place them on their side. Stay with the student and continue to observe. The injection will work quickly.</p>
